**Section – A**  
**(Reading – 20M)**

**1. Read the passage given below and answer the following questions: 20**

The water cycle is a continuous process that recycles the Earth's water supply through various stages. It begins with evaporation, where water from oceans, lakes, and rivers turns into water vapor due to the heat of the sun. This water vapor rises into the atmosphere and cools, leading to condensation. During condensation, the water vapor forms clouds. When the clouds become heavy, precipitation occurs in the form of rain, snow, sleet, or hail, depending on the temperature. This precipitation then falls back to the Earth's surface, replenishing groundwater supplies and surface water bodies.

Some of the water infiltrates into the soil and replenishes groundwater reserves, while the rest flows into rivers and streams, eventually returning to larger bodies of water like lakes and oceans. This process is crucial for maintaining the balance of ecosystems and ensuring a fresh supply of water for plants, animals, and humans. The water cycle is also vital for weather patterns and climate regulation, as it affects temperature and humidity levels around the globe.

Understanding the water cycle helps in managing water resources more effectively and addressing issues such as droughts and water pollution. By preserving natural water bodies and reducing pollution, we can support the natural processes that sustain this essential cycle.
